20 Fri, 16 Nov 2018 23:35:00 GMT Algebra Terms/Definitions and Examples - 12. A function is a set of ordered pairs such that for each domain element there is only one range element. The set of ordered pairs  $\{ (-2, 2), (-1, 1), (1, 1), (2, 2) \}$  is the only set that does not pair a domain element with two or more range elements.

13. A function maps each domain element to only one range element.
